UX Myths collects the most frequent user experience misconceptions and explains why they don’t hold true. And you don’t have to take our word for it, we’ll show you a lot of research findings and articles by design and usability gurus.

ACCESSIBLE SITES ARE UGLY

Accessibility on the web means making your content available to users with different skills and devices. A key requirement of web accessibility is to separate content (HTML) from visual appearance (CSS) in order to allow those preferring – or requiring – to use their own specific style sheet to access the content.

Since the visual appearance of a site is defined by style sheets, accessibility in itself should not have any impact on visual design.
